

# **18-819F: Introduction to Quantum Computing** **47-779/47-785: Quantum Integer Programming** **& Quantum Machine Learning**

## Course Overview

Lecture 00

2021.08.31.

# Agenda

- Lecturers
- Objectives
- Expectations
- Pre-requisites
- Tentative Course Outline Mini I & II
  - Teasers of new content to be learned
- Grading Policy
  - Project choices and examples
- Course Policy
- Videos and extra resources
- USRA Collaboration

# Lecturers

- **Prof. Sridhar Tayur**
  - Ford Distinguished Research Chair; University Professor of Operations Management; Tepper School of Business CMU
  - Academic Capitalist
- **Prof. Elias Towe**
  - Professor of Electrical and Computer Engineering
- **Dr. Davide Venturelli**
  - Associate Director for Quantum Computing of the Research Institute of Advanced Computer Science (RIACS) at the USRA.
  - Senior Scientist NASA Quantum AI Laboratory (QuAIL)
- **Dr. David E. Bernal**
  - Associate Scientist in Quantum Computing at USRA-RIACS and NASA QuAIL
  - 2019 awardee of USRA Feynman Quantum Academy Program at NASA Ames Research Center
- **Maximiliano Stock**
  - Civil Engineer. Researcher at INCAE Business School. Visitor at Tepper School of Business, CMU.
  - Finalist at the Airbus Quantum Computing Challenge 2019.

# Objectives

This course covers recent developments in **Quantum Computing** for the solution of **combinatorial optimization problems** and **machine learning (ML)**. We will cover mathematical programming and machine learning, their non-quantum (classical) solution methods and concepts that **take advantage** of **near-term quantum** and **quantum-inspired computing**. The **annealing** and **circuit model of quantum computing** that are currently implemented in various hardware architectures will be discussed.

We will explore how these machines can potentially be used for **hardware-tailored ML** algorithms to **solve problems that classical computers struggle with**.

The course contains a series of lectures and practical exercises using quantum resources such as quantum annealing and gate-based computers to gain exposure to these novel computational models, all through the **cloud-based Quantum Computing** access platform Amazon Braket.

The course main deliverable is a **final group project** that allows the students to familiarize themselves with a problem of their interest and apply classical and unconventional computing tools towards addressing these applications.

# Expectations

- This course is not going to focus on the following topics:
  - Computational complexity theory
    - 15-651 Algorithm Design and Analysis in CS
  - Quantum Information Theory
    - 33-658 Quantum computation and Info theory in Physics
  - Analysis of speedup using differential geometry, algebraic topology, etc.
    - 21-752 Algebraic Topology or 21-759 Differential Geometry in Mathematics

# Pre-requisites

- No explicit pre-requisites are listed but we recommend:
  - An **undergraduate-level** understanding of **probability, calculus, statistics, graph theory, algorithms, and linear algebra** is assumed.
  - Knowledge of **linear and integer programming** will be useful.
  - **Programming skills** are **strongly recommended** (Python preferred)
  - **Basic** concepts in **physics** are **recommended** but lack of prior knowledge is not an issue as pertinent ones will be covered in the lectures.
  - **No particular knowledge in quantum mechanics** or algebraic geometry is required.

# Tentative Course Outline First Half / Mini 1

- Introduction to Linear Algebra for Quantum Mechanics and Machine Learning:
  - Complex numbers, vectors and vector spaces, functions as vectors, inner product, norms, projections, Hilbert spaces, basis vectors, matrices, Hermitian operators, and special matrices
- Introduction to Mathematical Programming methods:
  - Linear Programming; Integer Programming; Nonlinear Programming; Mixed-Integer Nonlinear Programming; Introduction to computational complexity.
- Basic classical machine learning:
  - Support vector machine model; Deep learning neural networks; Running classical machine learning algorithms on computing systems with accelerators; Challenges of running machine learning algorithms on current state-of-the-art classical computing hardware
- Ising, Quadratic Unconstrained Binary Optimization (QUBO)
  - Ising model basics; Simulated Annealing, Markov-chain Monte Carlo methods, benchmarking classical methods, Formulating combinatorial problems as QUBOs.
- Introduction to Test Sets
  - Groebner basis; Graver basis; GAMA: Graver Augmented Multiseed algorithm; Applications: Portfolio Optimization, Cancer Genomics
- Physics-Inspired Hardware for solving Ising/QUBO
  - Graphical Processing Units; Tensor Processing Units; Complementary metal-oxide-semiconductors (CMOS); Digital Annealers; Oscillator Based Computing; Coherent Ising Machines

# Mathematical Programming – Discrete Optimization

## Current status and perspectives

Classical methods

Methods based on divide-and-conquer

- Branch-and-Bound algorithms
- Harness advances in polyhedral theory
- With global optimality guarantees
- Very efficient codes available
- Exponential complexity

Not very popular classical methods

Methods based on test-sets

- Algorithms based on “augmentation”
- Use tools from algebraic geometry
- Global convergence guarantees
- Very few implementations out there
- Polynomial **oracle** complexity **once we have test-set**

# Ising Model, QUBO

## Mental model and applications

$$Z = e^{\Psi} = \sum_j e^{-\beta H(\mathbf{x}_j, \mathbf{p}_j)}$$

$$Z = \sum_{s_1=0}^1 \sum_{s_2=0}^1 \dots \sum_{s_n=0}^1 \exp\left(\beta \sum_{i=1}^N \left[ J s_i s_{i+1} + H \frac{s_i + s_{i+1}}{2} \right]\right)$$

$$H = -J \sum_{i=1}^N s_i s_{i+1} - H \sum_{i=1}^N s_i$$

$$H = -\sum_{i=1}^N \left[ J s_i s_{i+1} + H \frac{s_i + s_{i+1}}{2} \right]$$

$$z(x) = \begin{cases} -1 & \text{if } x = 0 \\ +1 & \text{if } x = 1 \\ 0 & \text{otherwise} \end{cases}$$

$$\begin{aligned} \min \mathbf{c}\mathbf{x} \\ \mathbf{A}\mathbf{x} = \mathbf{b} \\ \mathbf{x} \in \{0,1\}^n \end{aligned} \quad \Rightarrow \quad \begin{aligned} \min_{\mathbf{x}} \mathbf{c}\mathbf{x} + \rho(\mathbf{A}\mathbf{x} - \mathbf{b})^T(\mathbf{A}\mathbf{x} - \mathbf{b}) \\ \mathbf{x} \in \{0,1\}^n \end{aligned} \quad = \quad \min_{\mathbf{x}} \mathbf{x}^T \mathbf{Q}\mathbf{x} + \mathbf{c} \\ \mathbf{x} \in \{0,1\}^n$$

# Tentative Course Outline Second Half / Mini 2

- **Axioms of Quantum Mechanics**
  - Postulates of quantum mechanics, review of classical bits (cbits), the single quantum state and the quantum bit (qubit); Quantum measurement, quantum operations; Multiple quantum states, observables
- **Qubit Gate model of quantum computing**
  - Reversible operations on qubits, logic gates and quantum circuits; Qubits for information processing; general quantum computation process; Example of the power of quantum computing, Deutsch's problem
- **Quantum methods for solving Ising/QUBO in the NISQ Era**
  - Adiabatic Quantum Computing, Quantum Annealing and D-Wave; QAOA: Quantum Alternating (Approximate) Optimization Ansatz (Algorithm); Exercises on Amazon Braket
- **Quantum Algorithms for future quantum processors**
  - HHL Algorithms for solving a system of linear equations ( $Ax = b$ ); Factorizing large numbers; period finding; quantum Fourier Transform; Quantum shell game; Grover's search algorithm
- **Noise in quantum computing and quantum error correction**
  - Review of classical error correction methods; quantum error correction

# Unconventional Computing

## Three Strategies, Multiple Technologies

### FAULT-TOLERANT QUANTUM:

- Phase Estimation
- Amplitude Amplification/Estim.
- Sampling

### GATE-MODEL NISQ:

- Quantum Approximate Optimization
- Quantum Alternate Operator Ansatz
- Variational Quantum Eigenolver
- Quantum Neural Networks

### ANALOG:

- Quantum Annealing
- Coherent (Optical) Ising Machines
- Oscillator-based Computing
- Quantum-Inspired Digital Annealers

## Relationship between QA and QAOA:

# Grading Policy

- The final project accounts for 70% of the grade and weekly short quizzes account for 30% of the grade
- Bi-weekly homework or quizzes (50%)
  - Each week will have a short quiz to evaluate concepts covered in previous lectures
  - Worst quizzes won't be counted
- Final Project (70%)
  - Group project (2-4 people).
  - Formulate a relevant practical problem as an IP or ML in multiple ways (formulations)
  - Generate a family of instances of the problem to test solution methods
  - Review current state-of-the-art classical solution methods. Replicate it if possible.
  - Identify opportunities for unconventional computing solution methods
  - Map the problem into a formalism fit for physics-based or -inspired methods
  - Perform resource estimation and solve a proof-of-concept instance(s) on a real device or simulator
- Deliverables:
  - Ungraded project proposal at the 3<sup>rd</sup> week to evaluate validity of idea (or for us to provide a problem)
  - Provide a mid-term report with initial results and plan (15 points /70) with a short presentation (10/70)
  - Code to implement project
  - Write a report outlining strengths-limitations-functional requirements-opportunities of the different approaches used, highlighting the knowledge obtained while developing the project supported by computational results (25/70)
  - Make a presentation to the class reporting the findings of the project (20/70)

# Project proposal ideas

## Multi-Input Multi-Output (MIMO) Maximum Likelihood Decoding problem

Many devices communicate with a base station. How to recover original message from noisy measurement?

<https://arxiv.org/pdf/2001.04014.pdf>

- Other projects:

Bring your own application!

It must be a machine learning / combinatorial optimization problem of interest suited for quantum computing

## Image processing and classification

(a)

(b)

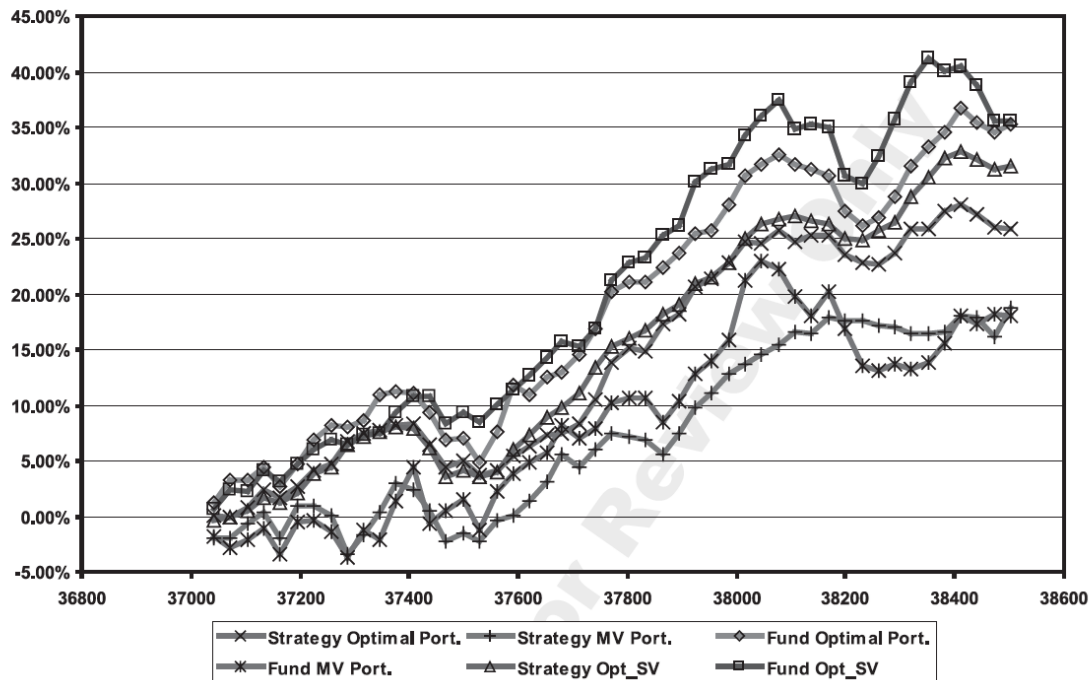

Given an image and a group of categories. How to use quantum computing to help with image classification?

<https://arxiv.org/pdf/2008.05859.pdf>

# Project proposal from Industry

## Principal Financial Group: Hedge Fund portfolio optimization with Kurtosis and Skewness

Cumulative HF Portfolio Returns

<p><i>Purpose</i></p> <p><i>(What is the project motivation?)</i></p>	<ul style="list-style-type: none"> <li>The purpose of this project is to adopt Ising’s model to solve a complex Optimization problem incorporating higher moments i.e. Skewness and Kurtosis into the objective function.</li> <li>The goal is to establish a framework through which a reformulation of the problem is possible.</li> <li>Its purpose is also to push the boundaries of optimization problem by incorporating other practical constraints such as mixed-integer formulation.</li> </ul>
<p><i>Objectives</i></p> <p><i>(What are we going to do?)</i></p>	<ul style="list-style-type: none"> <li>Perform a literature review of Ising’s model with particular focus on its relevance to Portfolio Optimization</li> <li>Reformulate the Optimization problem incorporating higher order moments so that it is amenable to be solved using the Ising’s model.</li> <li>Develop a working prototype of the proposed methodology</li> <li>Define metrics and validation procedures for evaluating model performance – both accuracy as well speed.</li> <li>Define and prototype benchmarks for comparison. Consider baseline Mean Variance Optimization for this purpose.</li> <li>Demonstrate a prototype of the developed methodology on a large dataset</li> </ul>
<p><i>Output</i></p> <p><i>(What are the project deliverables?)</i></p>	<ul style="list-style-type: none"> <li>A thorough report of literature review identifying literature relevant to adopting Ising’s model to Portfolio Optimization.</li> <li>Establish a framework for reformulating the optimization problem using Ising’s model.</li> <li>A working prototype implementing Ising’s model for addressing complex Portfolio Optimization problem.</li> <li>Documentation for the proposed mathematical formulation.</li> </ul>
<p><i>Outcome</i></p> <p><i>(Expected impact on which sub-system[s]?)</i></p>	<ul style="list-style-type: none"> <li>A richer formulation incorporating higher order moments of returns namely, Skewness and Kurtosis in addition to Mean and Variance leads to renewed focus on traditionally neglected aspects of return distribution.</li> <li>This reformulation would play a pivotal role in transforming the portfolio manager mindset and development of this framework would allow us to rapidly prototype and readily implement it.</li> <li>Incorporating higher order moments of return is beset with mathematical complexities and obstacles arising from practical computational limitations. This novel approach to solve this problem circumvents these traditional limitations.</li> </ul>

# Project examples

## Maritime Routing Problem

Real-life application problem

<https://ieeexplore.ieee.org/iel7/8924785/9347847/09314905.pdf>

## Max-k-coloring and stable-set of a graph

Graph theoretical

<https://arxiv.org/pdf/2101.09462.pdf>

- Other applications in Finance, Engineering, and Sciences

# Other applications

## Applied:

- Air Traffic Management
- Portfolio Optimization
- Airport Gate Scheduling
- Autoencoders
- Anomaly detection in networks
- Vehicle Routing
- Robot Operations Planning

## Paradigmatic:

- SAT
- Traveling Salesman Problem
- Job Shop Scheduling
- Spin Glasses

# Course Policy

- Auditing students are encouraged to participate actively in the lectures
  - Consider doing the project, one learns by doing
- Regular attendance is essential and expected
- CMU students: use canvas
  - The quizzes are being posted there
  - Questions should be asked there to make it available to everyone
  
- Academic honesty is expected. Refer to the CMU's policies on academic integrity when in doubt.

## Why Universities Exist

“The justification for a university is that it preserves the connection between **knowledge and zest of life**, by uniting the young and old in the imaginative consideration of learning...The task of the university is to **weld together imagination and experience**.....The task of the university is the **creation of the future**....”
